

Manufacturing & Converting

G3 s.r.o. provides shape diecutting and other processing of 3M™ adhesive products, which can be combined with a wide range of other materials.

The processed materials can be adhesive or non-adhesive.

The cuts can be carried out out of a wide range of materials such as crude rubber, microporous rubber, PUR foam or plastic film. In dependence on customer needs we will recommend the right material with the requisited properties, color, thickness and hardness.

If an adhesive product is to be used, the type of the adhesive coating which best suits the customer's requirements for the resulting bond strength and environmental resistance (temperature, humidity, chemical resistance) can be chosen.
